SPECIFICATIONS

Type.....	Soft touch, front loading stereo cassette deck
Track system.....	4 track, 2 channel stereo recording/playback
Recording system.....	AC bias system(bias frequency:90KHz)
Erasing system.....	AC system
Tape speed.....	1-7/8 ips (4.76Cm/sec)
Heads.....	Super hard permalloy recording/playback head x 1, Double gap erasing head x 1
Motor.....	Electronic governor controlled DC motor
Wow and flutter.....	Less than 0.07%(WRMS)
Fast winding time.....	Approximately 105 seconds with C-60 cassette tape
Frequency response	
-20dB RECORDING.....	Normal tape 25-14,500Hz(30-13, 500Hz \pm 3dB) CrO ₂ tape 25-15,000Hz(30-14,000Hz \pm 3dB) METAL tape 25-15,000Hz(30-14,500Hz \pm 3dB)
OdB RECORDING.....	METAL tape 30-10,000Hz \pm 3dB
Signal to noise ratio (REC/PB)	
Dolby NR ON.....	64dB(Normal tape)
(Weighted).....	66dB(CrO ₂ and METAL tape)
Dolby NR OFF.....	55dB(Normal tape)
(Weighted).....	57dB(CrO ₂ and METAL tape)
THD.....	Less than 1.0% at 1KHz, OdB RECORDING
Input sensitivity/Impedance.....	MIC 0.4mV/600-6.8K ohms LINE 90mV/47K ohm
Output level/Load impedance.....	LINE 380mV/1.2K ohms
Power consumption.....	11 Watts
Dimesions.....	440(W)x115(H)x265(D)mm
Unit weight.....	5.0Kg
NOTE:Specifications and the design subject to change without notice for improvements.	

ELECTRICAL ADJUSTMENT PROCEDURE

To make the adjustments the following instruments are necessary:

- * High sensitivity AC voltmeter
- * Audio frequency oscillator
- * Attenuator
- * Oscilloscope
- * Distortion meter
- * Wow and flutter meter w/frequency counter
- * CCIR/ARM noise Weighting filter
- * Test tape

I. TAPE SPEED

1. Connect the wow and fluttermeter to OUTPUT terminals.
 - * Output terminals: Line Output
2. Play back the 3KHz, -10dB signal of the test tape (MTT-111)
3. Insert a small-screwdriver into the adjustment hole (= behind of the motor), and adjust the semifixed resistor till the wow and flutter meter reads 3KHz.
 - * If the speed is low, turn the resistor clockwise.
 - * If the speed is high, turn it counter-clockwise.

II. HEAD AZIMUTH(Fig. 1)

1. Set the TAPE selector (EQ) to NORM.
2. Connect the voltmeter and oscilloscope to OUTPUT terminals.
3. Play back the 10KHz, -10dB signal of the test tape. (MTT-114)
4. Observing the voltmeter, turn screw(REC/P. B head adjusting screw) to maximize the signal, on both the left and right channels.
5. After adjustment, be sure to lock screw so that it cannot move.

Fig. 1

III. PLAYBACK LEVEL

1. Connect the voltmeter and oscilloscope to the OUTPUT terminals.
2. Switch the DOLBY NR switch OFF.
3. Set the output level volume to be maximum position.
4. Playback the 400Hz, +3dB (= 0.540V) signal of the test tape (MTT-150).
5. VR102R(right) and VR102L(left) should be adjusted till the voltmeter read is 0.540V.

IV. PLAYBACK EQUALIZER

1. Set the TAPE selector to NORM.
2. Set the Dolby NR switch to be OFF.
3. Set the output level volume to be maximum position.
4. Connect the voltmeter and oscilloscope to the OUTPUT terminals.
5. Playback the 12.5KHz/1KHz/40Hz, -24dB signal of the test tape. (MTT-217G)
6. Read output at 1KHz playback and Adjust VR101R (right) and VR101L(left) on the EQ amplifier until the voltmeter indicates +2dB at 12.5KHz playback than output at 1KHz playback.
7. In playback of the test tape (MTT-217G), set the TAPE selector to CrO₂ and Metal position, then confirm the indication on AC voltmeter at 12.5KHz playback is dropping down approximately 4dB compare with NORM position.
 - * Standard frequency: 1KHz

V. LED LEVEL METER CALIBRATION

1. Apply a 400Hz signal to the INPUT terminals (= line input) and put the deck in the REC mode.
2. Connect the voltmeter and oscilloscope to the OUTPUT terminals.
3. Switch the Dolby NR switch OFF.
4. Set the output level volume to be maximum position.
5. Adjust the REC level volumes till the OUTPUT from the OUTPUT terminals is +3dB (= 0.540V).
6. Adjust VR301R(right) and VR301L(left) until the LED meter indicates exactly "+3"dB or DOLBY mark (= ).

VI. FM MPX FILTER

1. Set the output level volume to be maximum position.
2. Connect the voltmeter and oscilloscope to the OUTPUT terminals.
3. Apply the 400Hz signal to the INPUT terminals (= line input) and put the deck in the REC mode.
4. Control the REC level volumes till the OUTPUT from the OUTPUT terminals is approximate +3dB (= 0.540V).
5. Apply the 19KHz signal to the INPUT terminals (= line input) and put the deck in the REC mode.
6. Adjust LPF-R L101R(right) and LPF-L L101L (left) on the MPX filter processor (only white color mark core) so as to minimize the signal coming out of the OUTPUT terminals.

VII. RECORDING BIAS

1. Set the REC level controls to their minimum positions and put the deck in the record mode.
2. Set the TAPE selector to "NORM".
3. Connect the voltmeter to test point T. P2(right) and T. P1(left) on the P. B amplifier.
4. Adjust VR104R(right) and VR104L(left) until the voltmeter reads 3.4mV (= 340uA).
5. Check
 - * Cr02: Adjust VR105 until the voltmeter reads 4.6mV (= 460uA)
 - * METAL: Adjust VR106 until the voltmeter reads 7.5mV (= 750uA)

VIII. BIAS TRAP

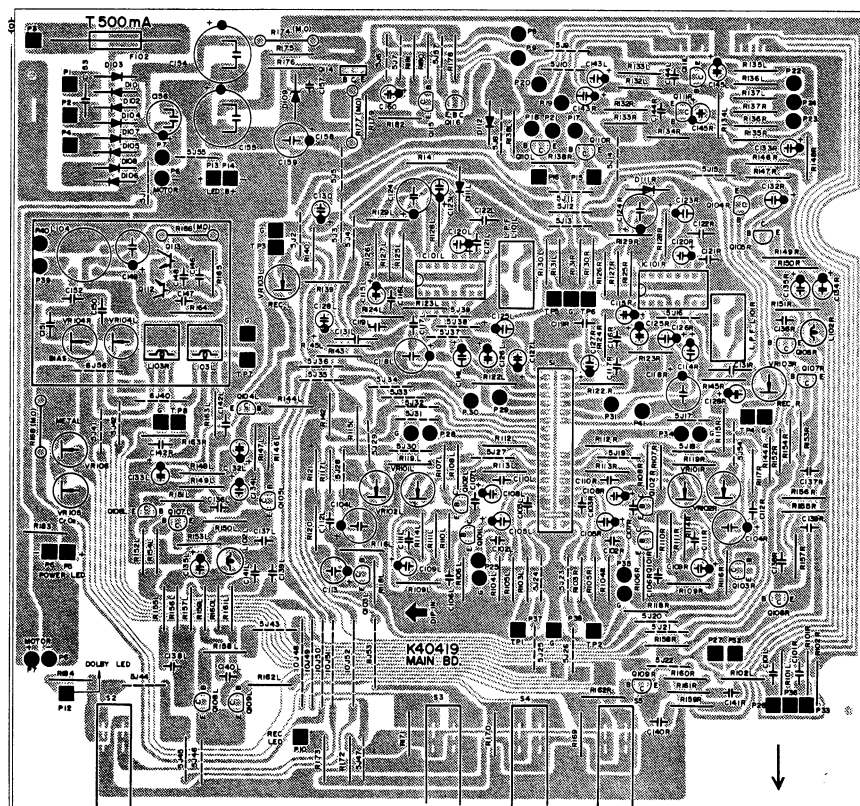

1. Put the deck in the record mode and set the REC level controls to their minimum position.
2. Set the tape selector to METAL.
3. Connect the voltmeter and oscilloscope to terminals T. P8 (right) and T. P7 (left) on the REC amplifier.

4. Adjust L103R(right) and L103L (left) until the output of the bias wave form is minimized.

IX. RECORDING LEVEL

1. Apply a 400Hz signal to the INPUT terminals (= line input) and put the deck in the REC mode.
 - * Set the output level volume to be maximum position.
2. Connect the voltmeter and oscilloscope to the OUTPUT terminals.
3. Adjust the REC level controls until the OUTPUT from the OUTPUT terminals is +3dB (= 0.540V).
4. Connect the voltmeter to test point T. P4(right) and T. P3(left) on the REC amplifier.
5. Set the TAPE selector to NORM.
6. Adjust VR103R (right) and VR103L (left) until the voltmeter reads about -9~-10dB.
